

Session 6: Data sources, details, and derivations (oh my!)

Cat Anderson

Outline

Data sources:

- Tongan data:

- Census data
- Births data
- Deaths data
- Migration data

$$P_{t+1} = P_t + \underbrace{B - D}_{\text{Natural increase}} + \underbrace{I - O}_{\text{Net migration}}$$

- 3rd party sources
- Open up for discussion

Tongan data sources

Tongan data sources – census data

Census data is a count of the number of people where Tonga is their **place of usual residence**.

Census data is a good starting point for calculating the **base population**.

Census count is as at midnight of the census date, 30th November.

Base population counts can be:

- Annually
- Half-yearly
- Quarterly
- Monthly
- Lots of different dates!

How do we derive the population at a different date?

Tongan data sources – births and deaths data

Births data can be grouped by **date of birth** OR **date of registration**.

Deaths data can be grouped by **date of death** OR **date of registration**.

Time between registration and occurrence varies

How do we account for a lag between occurrence and registration?

- Release data after complete
- Revise previous data
- Add x% to initial data

Tongan data sources – migration data

Net migration is comprised of two components: **arrivals** and **departures**.

Migration data for defined groups of travellers can follow different trends.

Migration data may need to be broken down into finer detail.

How do we derive data at a finer granularity?

- Applying trends/ratios
- Interpolation
- Modelling

Methods of Interpolation

Interpolation is often based on **mathematical formulae**, or the application of **coefficients**.

$$P_{10-14}^{2018} = P_{5-9}^{2013} + (M-D)^{2014}_{6-10} + (M-D)^{2015}_{7-11} + (M-D)^{2016}_{8-12} + (M-D)^{2017}_{9-13} + (M-D)^{2018}_{10-14}$$

where P = Population at 30 June

M = Net Migration for year ending 30 June

D = Deaths for year ending 30 June

Karup-King third-difference formula:

Karup-King splits the whole population into 3 “panels” (first, middle, last), and then applies a coefficient depending on the position of the single year in its group

- E.g. For the 5-9 year group, 5 is the first position, 6 is the second, 7 is the third etc.

First panel			
Interpolated Subgroup	G1	G2	G3
1st	0.344	-0.208	0.064
2nd	0.248	-0.056	0.008
3rd	0.176	0.048	-0.024
4th	0.128	0.104	-0.032
5th	0.104	0.112	-0.016
Middle panel			
Interpolated Subgroup	G1	G2	G3
1st	0.064	0.152	-0.016
2nd	0.008	0.224	-0.032
3rd	-0.024	0.248	-0.024
4th	-0.032	0.224	0.008
5th	-0.016	0.152	0.064
Last panel			
Interpolated Subgroup	G1	G2	G3
1st	-0.016	0.112	0.104
2nd	-0.032	0.104	0.128
3rd	-0.024	0.048	0.176
4th	0.008	-0.056	0.248
5th	0.064	-0.208	0.344

Methods of Interpolation

Sprague fifth-difference formula:

Sprague splits the whole population into 5 “panels” (first, second from first, middle, second from last, last), and then applies a coefficient depending on the position of the single year in its group

- E.g. For the 5-9 year group, 5 is the first position, 6 is the second, 7 is the third etc.

Other formulae:

- Beers Ordinary Formula
- Beers Modified Formula
- Grabill modification of Sprague formula
- And many more!

		First panel				
Interpolated Subgroup		G1	G2	G3	G4	G5
1st		0.3616	-0.2768	0.1488	-0.0336	
2nd		0.2640	-0.0960	0.0400	-0.0080	
3rd		0.1840	0.0400	-0.0320	0.0080	
4th		0.1200	0.1360	-0.0720	0.0160	
5th		0.0704	0.1968	-0.0848	0.0176	
		Second from first panel				
Interpolated Subgroup		G1	G2	G3	G4	G5
1st		0.0336	0.2272	-0.0752	0.0144

5th		0.0016	-0.024	0.1504	0.0848	-0.0128
		Second from last panel				
Interpolated Subgroup		G1	G2	G3	G4	G5
1st			-0.0144	0.0912	0.1408	-0.0176
2nd			-0.008	0.04	0.184	-0.016
3rd			0	-0.008	0.216	-0.008
4th			0.008	-0.048	0.232	0.008
5th			0.0144	-0.0752	0.2272	0.0336
		Last panel				
Interpolated Subgroup		G1	G2	G3	G4	G5
1st			0.0176	-0.0848	0.1968	0.0704
2nd			0.016	-0.072	0.136	0.12
3rd			0.008	-0.032	0.04	0.184
4th			-0.008	0.04	-0.096	0.264
5th			-0.0336	0.1488	-0.2768	0.3616

Smoothing

Smoothing techniques can be used to make the data flow more smoothly from one age group to the next, and reducing random variation.

Smoothing techniques include:

- Rectangular smoothing
- Exponential smoothing
- Moving averages

Summary

- We are estimating the population at a point in time
- Our components may be incomplete
 - Base – some people may be missing from the census counts
 - Births – some may take a while to be registered or remain unregistered
 - Deaths – some may take a while to be registered or remain unregistered
 - Migration – some travellers may be missing from the data; migrants may be swamped in number by short-term travellers
- Our components may have errors
 - Respondent errors
 - Processing errors
 - Missing and incomplete responses
- All components of population estimation potentially need adjustment

Extracting information from Infoshare (Stats NZ)

The screenshot shows the Stats NZ Infoshare website interface. At the top, there are navigation tabs: **Browse**, **Search**, **Load query**, **Export direct**, **Help**, and **Glossary**. Below the tabs, there is a section titled "Infoshare: Connecting you to a wealth of information" with introductory text and links for help and data changes. A "Subject categories" section follows, listing various data categories with a red box highlighting "International Travel and Migration - ITM". A "Notices" section at the bottom provides additional information about data releases and schedules. The footer contains links for "About Infoshare", "Accessibility", "Help", "Copyright & terms of use!", "Privacy", and "Contact us", along with the website URL "stats.govt.nz" and "newzealand.govt.nz".

Estimated migration by direction and country of citizenship, 12/16-month rule (Annual-Dec)		
	Estimate	
	2021	
	Arrivals	Departures
Tonga	276	687

Table information:
Units:
Number, Magnitude = Units

Footnotes:
The standard error indicates the uncertainty of the provisional migration estimate. For example, the 95 percent confidence interval is +/-1.96 standard errors. These intervals reflect the model uncertainty, not the extent of future revisions to provisional data. Standard errors are non-additive. Owing to rounding, individual figures may not sum to stated totals.

Thanks for listening!

Session 6 (cont.): Practical exercises for deriving data

Cat Anderson & Kim Dunstan

Exercise 1: Deriving Births and Deaths Data

Time between registration and occurrence varies

→ Need to account for lag

Lag Data: “Workshop Materials – Births and Deaths lag data.xlsx”

- 2020H2 has incomplete data.
 1. Using the lag data, calculate a plausible births estimate for 2020H2, for males, females, and total sex.
 2. Do the same for deaths x sex x SYOA in 2021H1.
- No data is available for 2021.
 1. Using previous year and half-year trends, calculate plausible births estimates for 2021H1 and 2021H2.
 2. Do the same for deaths x sex x SYOA in 2021H2.

Exercise 2: Deriving SYOA from 5-year age groups

We have data for sex and SYOA for base population, births, and deaths.

We only have data for sex for migration.

- Derive SYOA data for arrivals and departures for each sex (male, female, total) using:
 1. Previous year trends for males, females, and total sex (“2019 SYOA data.xlsx”).
 2. The Karup-King method of interpolation (“Component Data.xlsx”, sheet = “Karup-King”).
 3. The Sprague method of interpolation (“Component Data.xlsx”, sheet = “Sprague”).
- Calculate net migration x sex x SYOA for all periods.
